Subject: SI and H. Experimentation, 16 January 1952

On Wednesday, 16 January 1952, SI and H experiments were carried on the Building 11, Room 20, with Misses

After a general discussion from the standard "arm raising" test of the standard "late onverted the arguralising test into a general slow relaxation. As heretofore noted, left arm responded to the test while her right arm did not leave the arm of the chair. She, however, did attain a light trance state to such an extent that both arms were completely limp and she was undisturbed by dropping them. There were, was unable to produce a catalepsy from the standard that the chair same at this time. Furthermore, it was noted upon questioning, after arkening that she did not recall her arm's being dropped.

and was able to produce a very strong hand raising. Thereafter, Ittempted to produce a complete relaxation by the slow relaxation method using fixation on a watch on the successful although the strong strong strong the strong strong

then, without trying a "hand redsing" test with and using a fixation method, induced we into a very light trance state with a post hypnotic that she would be able to sleep again when directed.

Method and shortly thereafter instructed her to go to sleep, which did, reaching a somewhat deeper trance state than before although the sleep that the sleep is the reawakened by the 123L5 method again.

At the conclusion of these tests, a short general discussion followed and work was concluded at approximately 9:00 PM.
